07 Contribution Opportunity [p. 9]

Data sources

06 Data Source [p. 9]

Entity IDs stay the same on every page.

Index [p. #] points to attribute details.

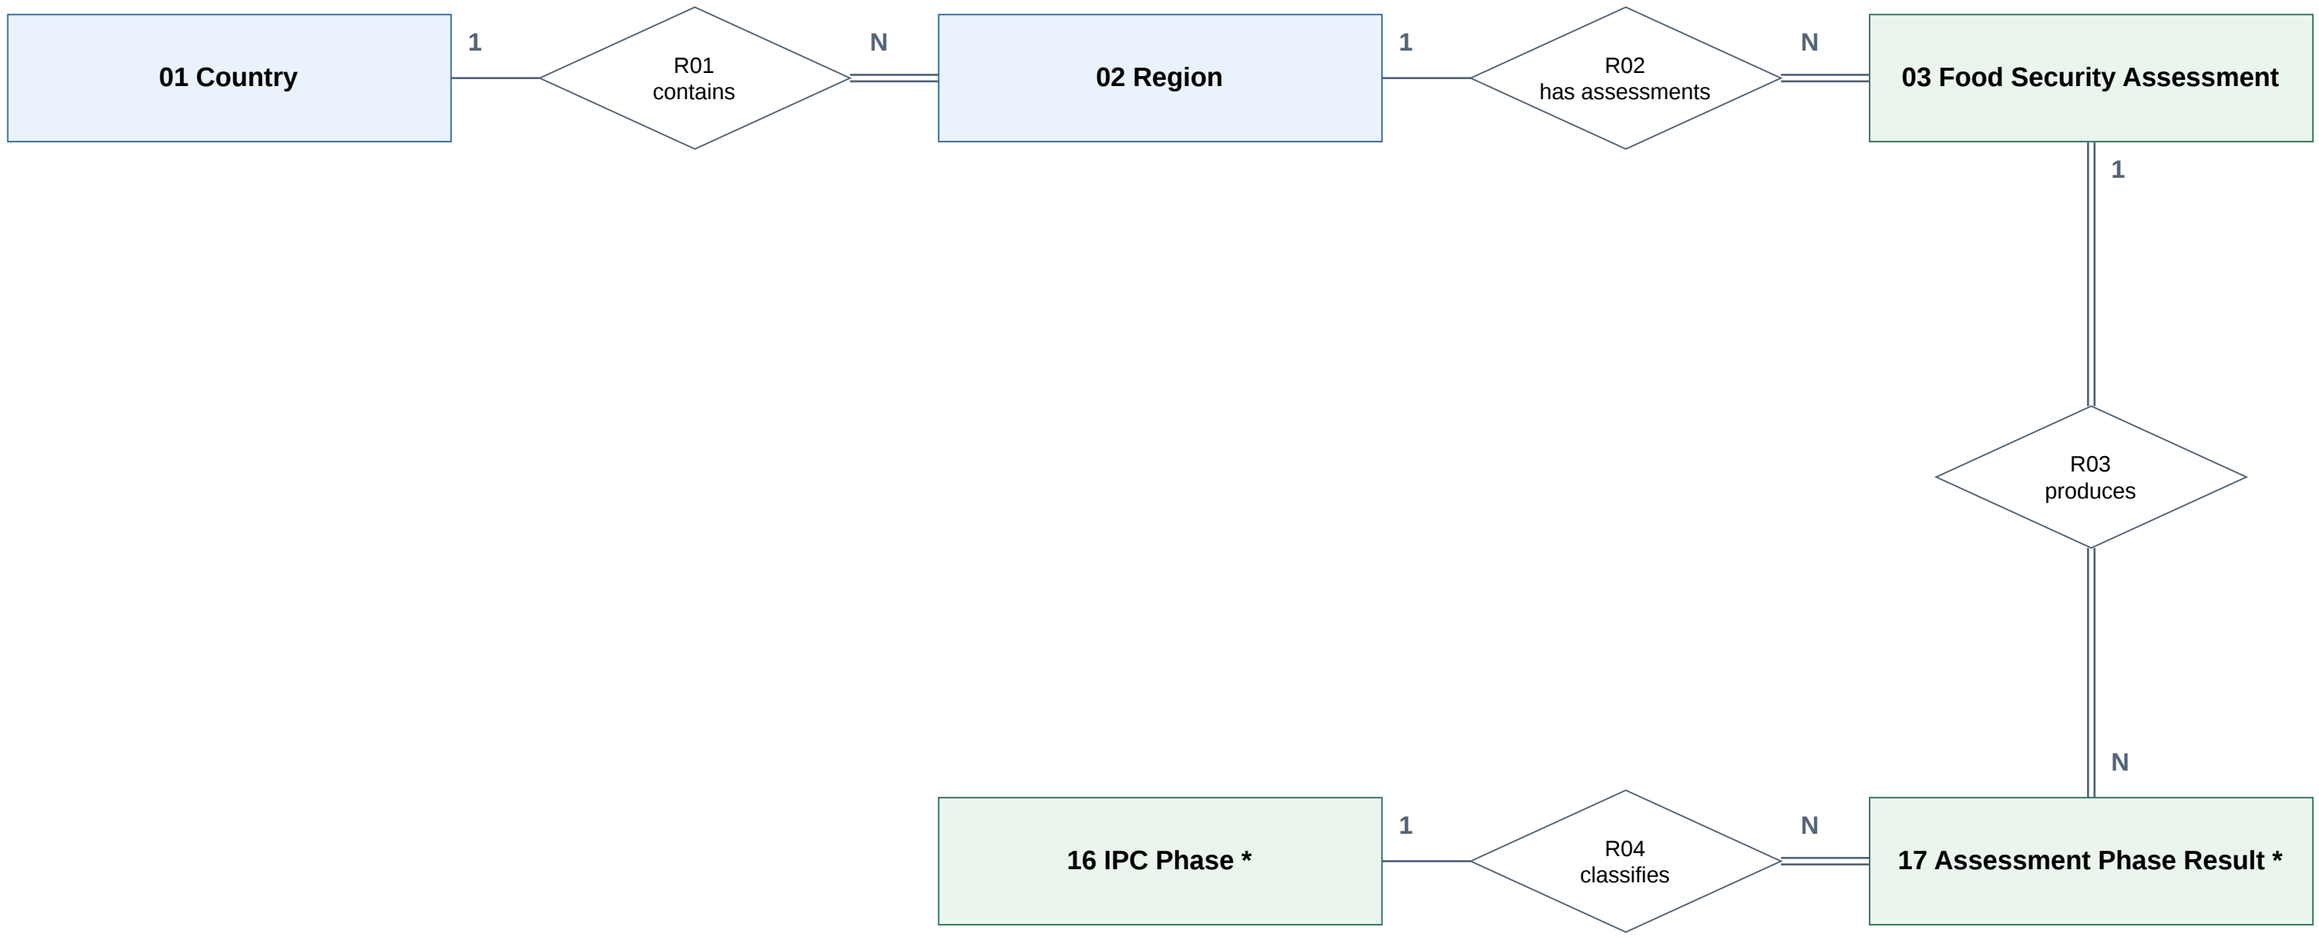

Shared-source links are isolated on page 7.

Pages 2-6 retain relationships.

Attributes appear on pages 8-12.

Geography & food-security assessments

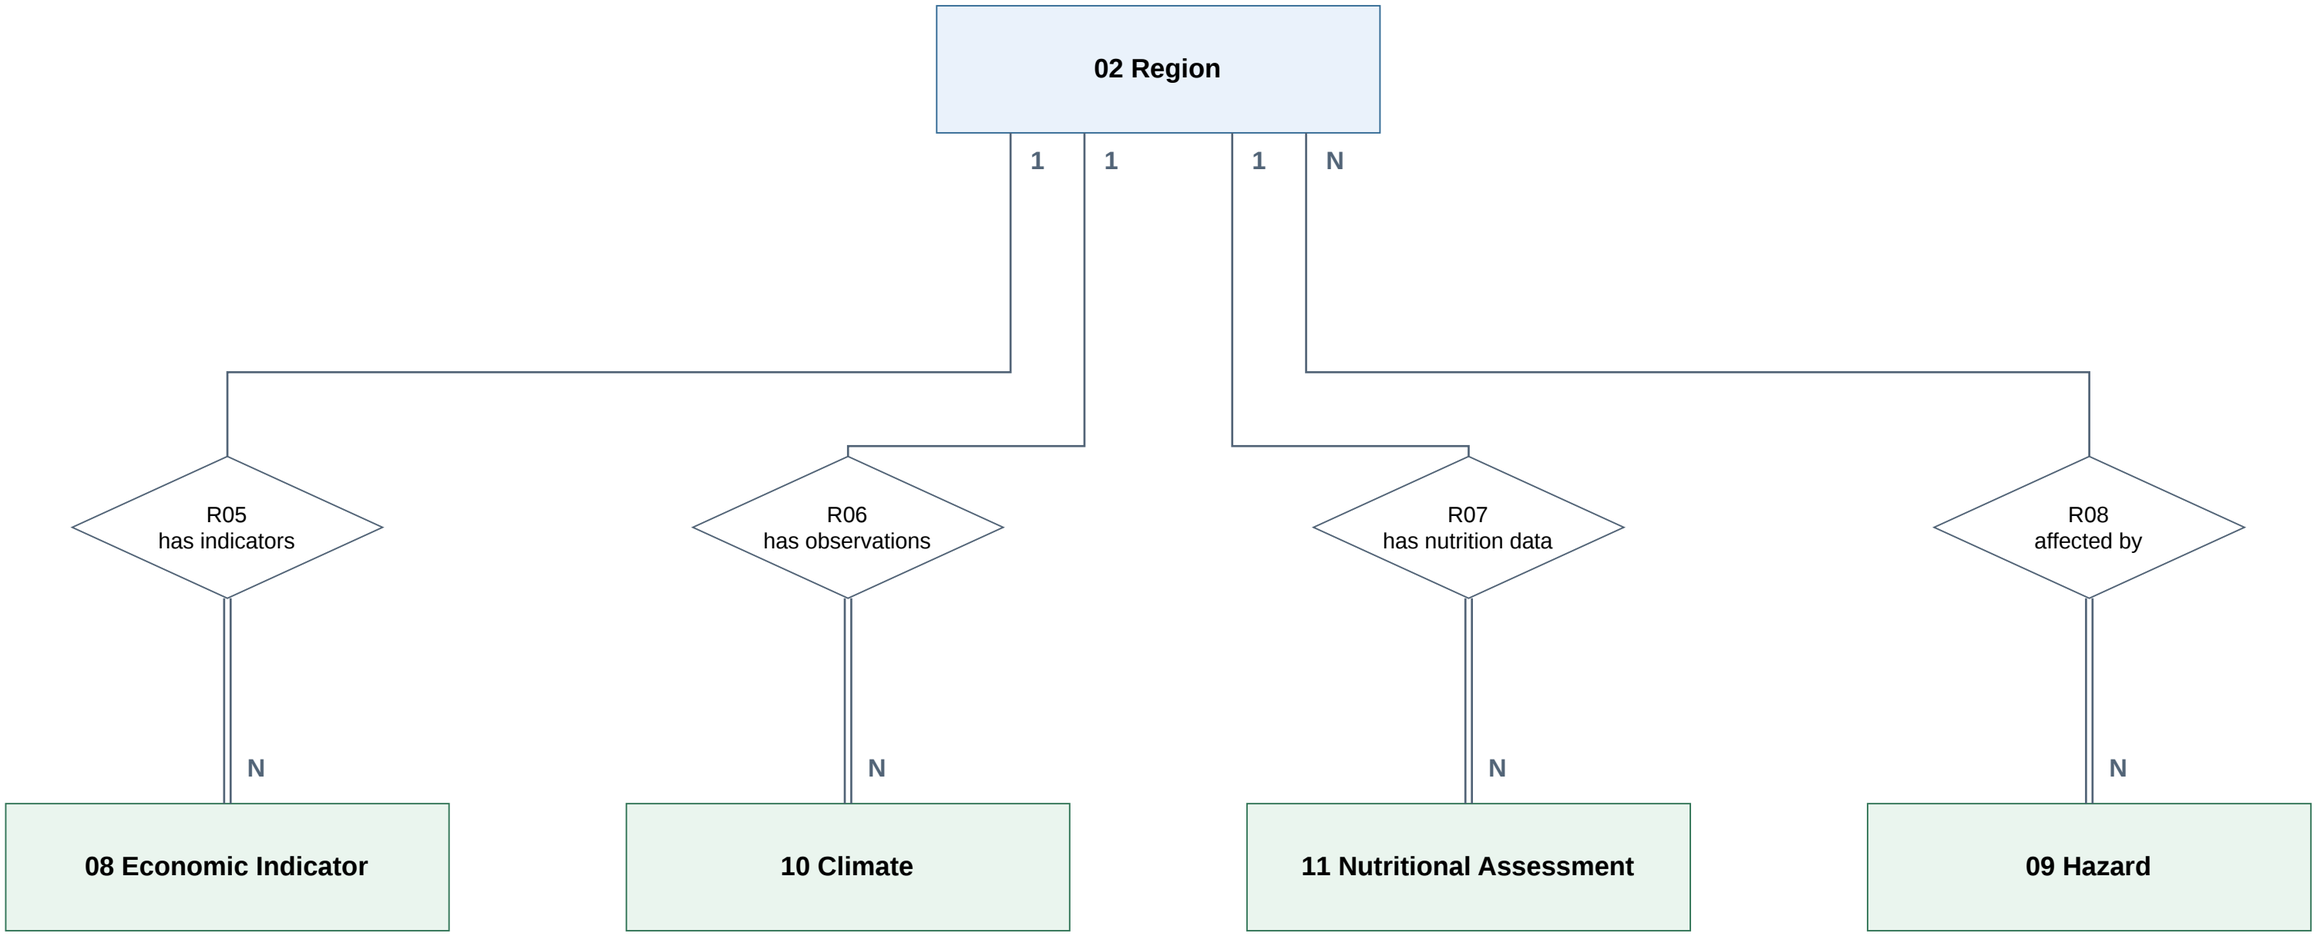

A region has dated assessments; each completed assessment produces phase results classified by an IPC Phase.

One result per assessment/phase pair. Percentage is derived from the phase count and the assessment population. Source relationship R18 is on page 7.

Regional conditions

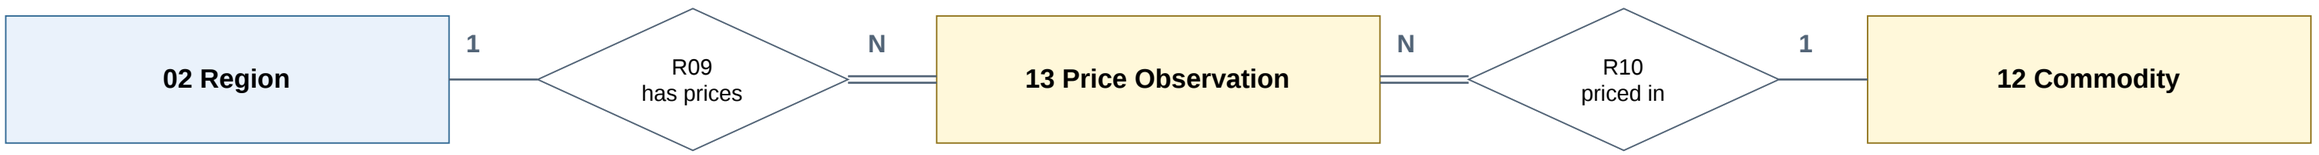

Economic, climate and nutritional measurements describe regional conditions. Hazards can affect several regions.

Each measurement belongs to one region; Hazard-Region is many-to-many. Dates and units make observations comparable. Source relationships R19-R22 are on page 7.

Food prices

Each observation records one commodity price in one region, with an explicit date, currency and quantity basis.

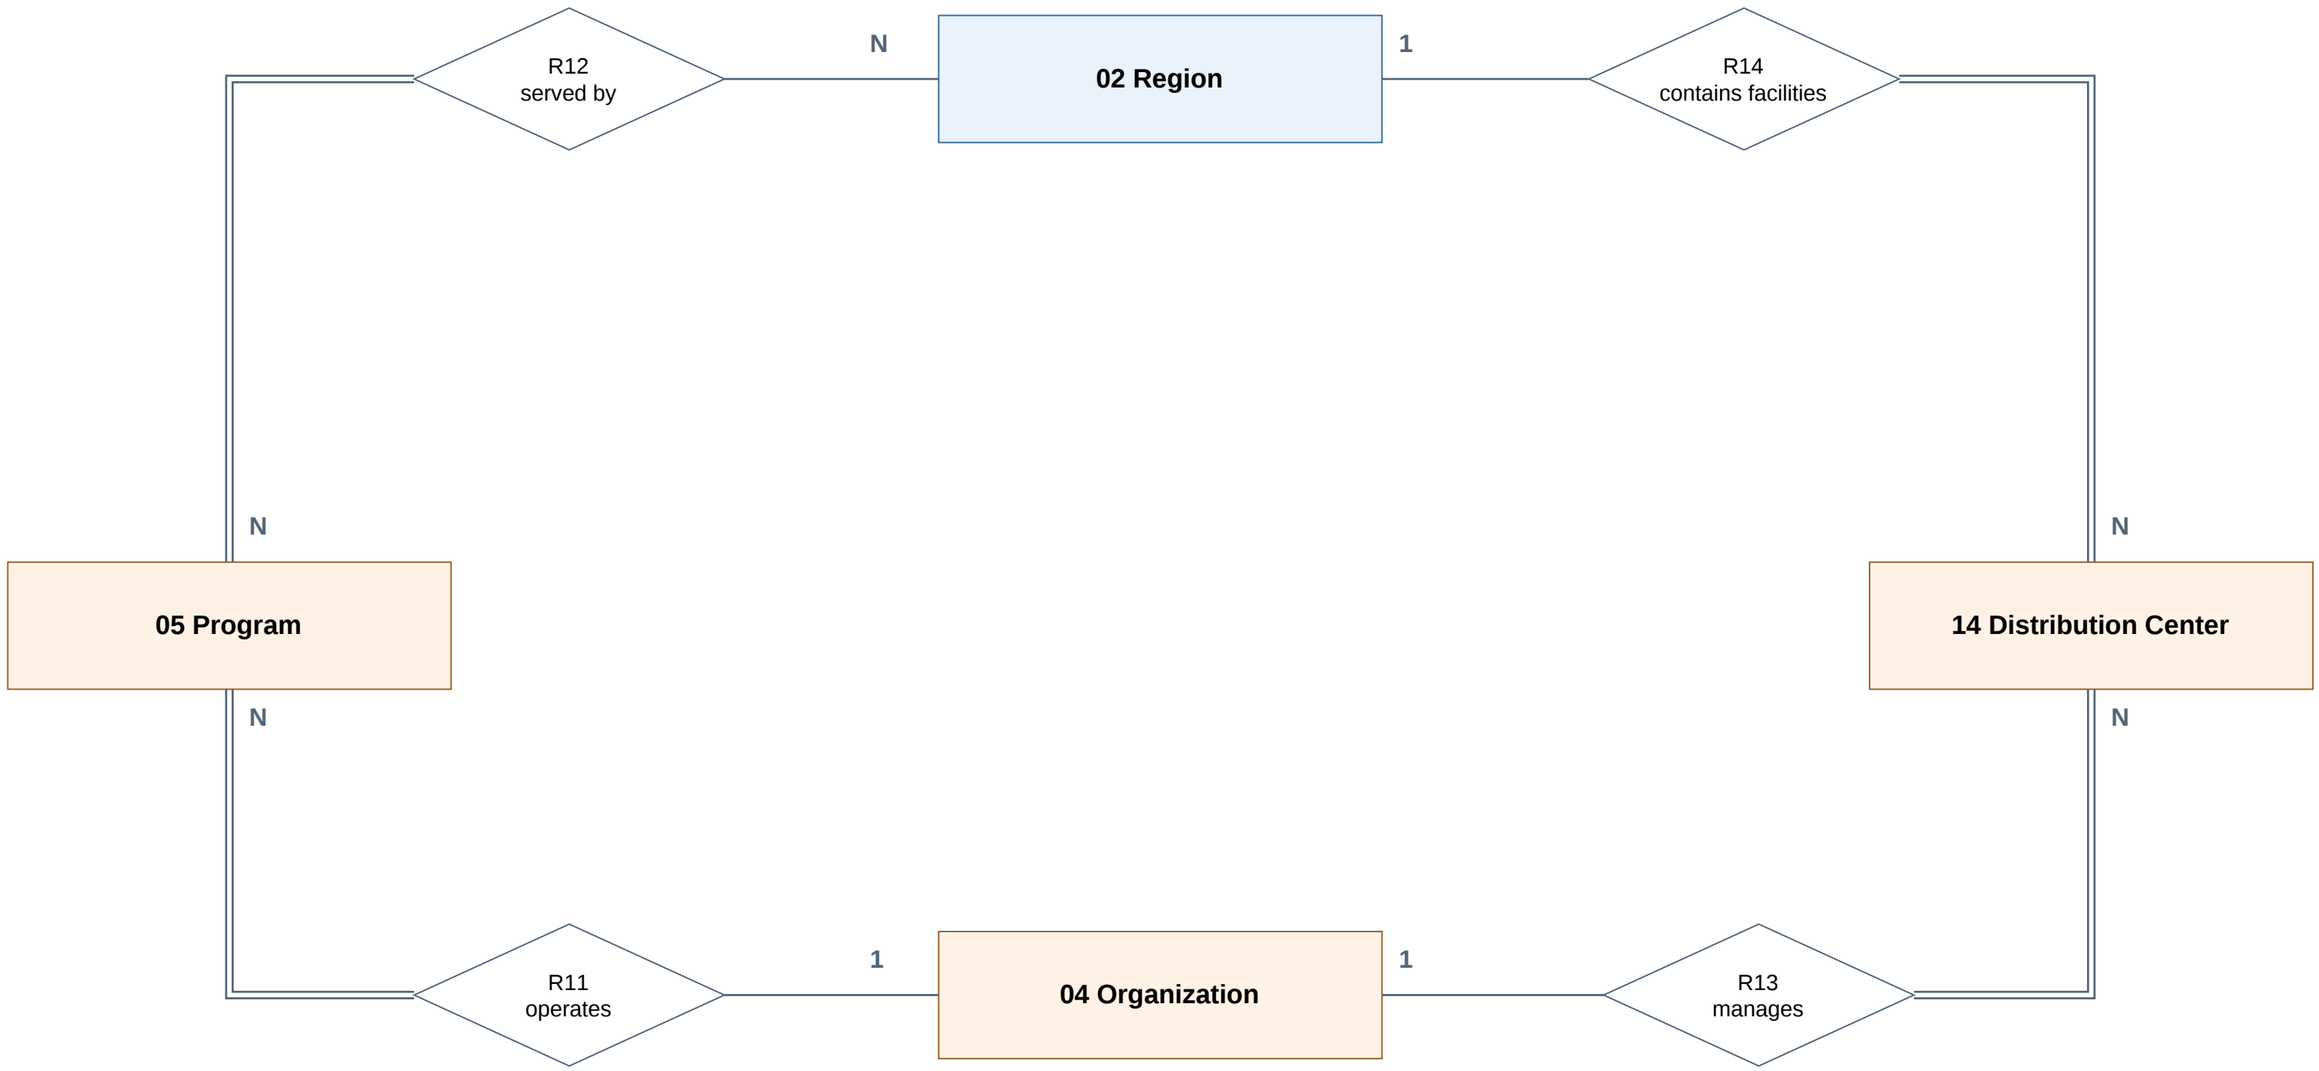

Interpreting a price

Compare the same product grade, currency, quantity unit and market basis.
A commodity can have many observations across different regions and dates.

'Data Source' documents each Price Observation through R23 on page 7. Commodity definitions are reused; price is not a single attribute of Commodity.

Assistance coverage & facilities

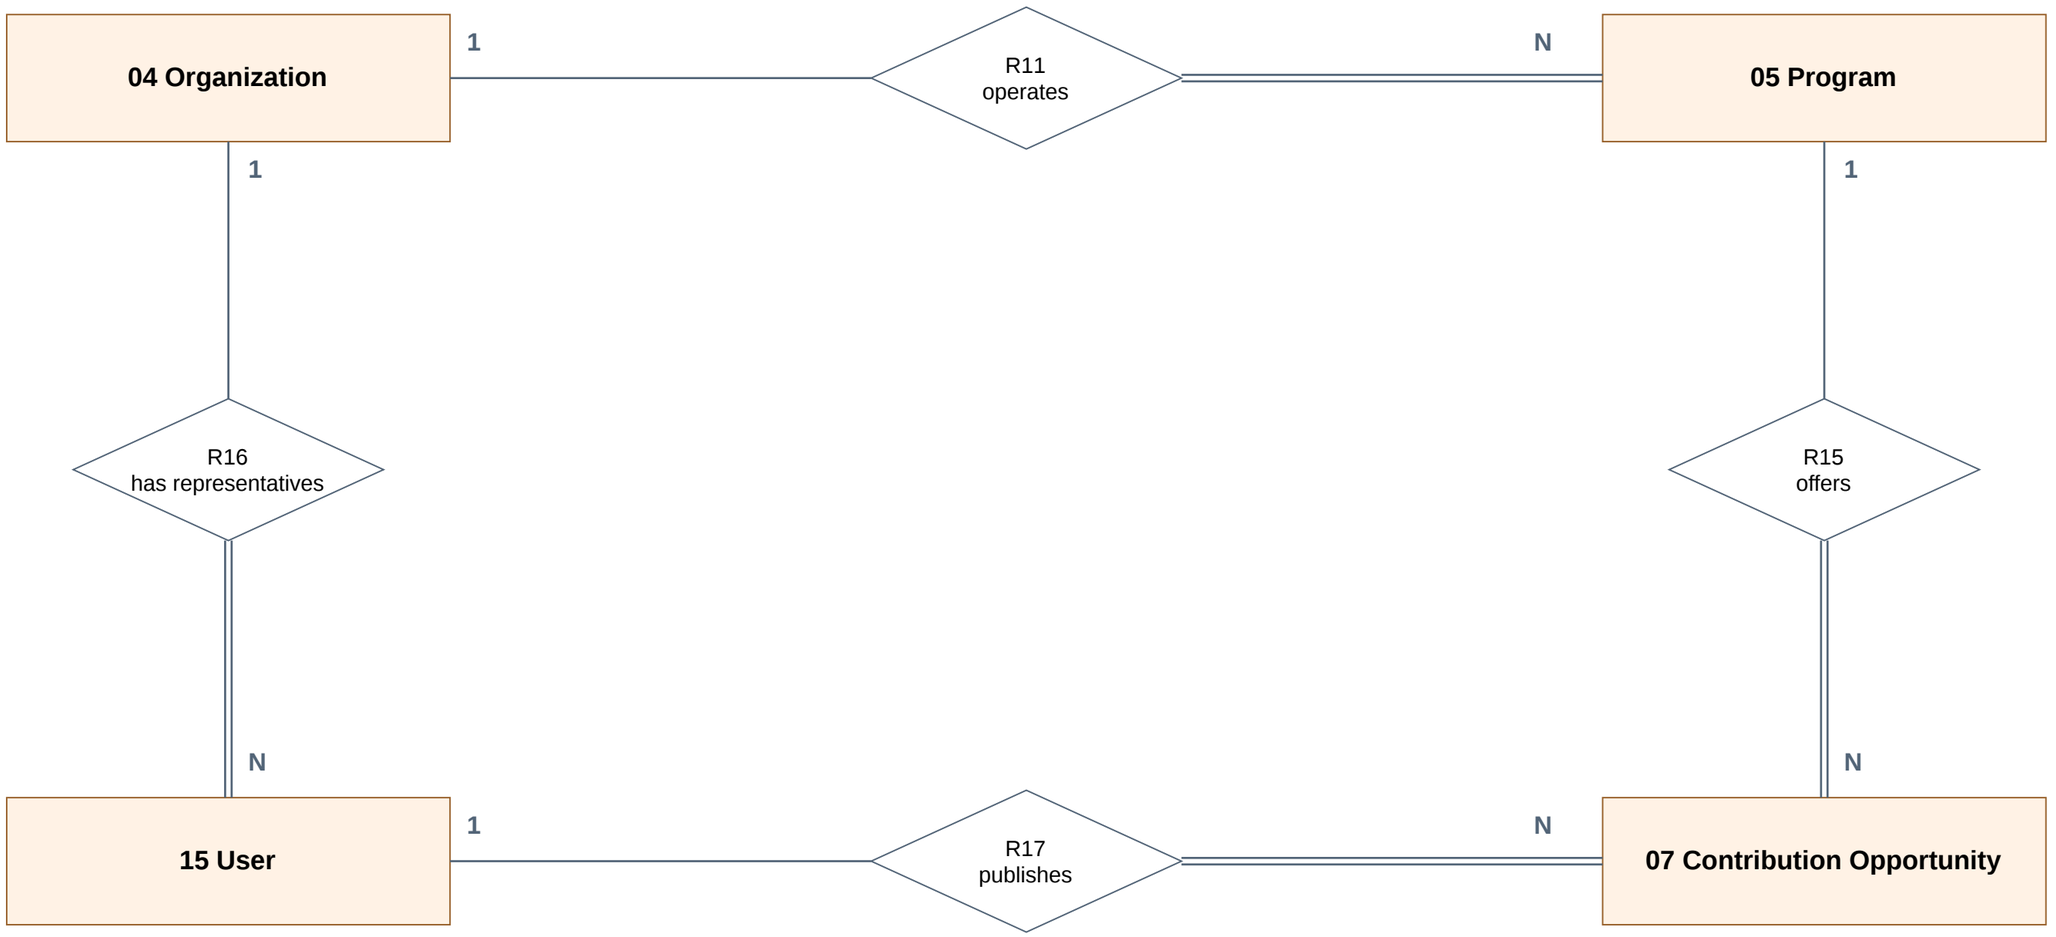

Organizations operate programs and manage facilities. Regions connect both forms of assistance to the map.

Program-Region is many-to-many. Every Program and Distribution Center has one responsible Organization; every center is located in one Region.

Contribution publishing & ownership

Registered organization representatives publish opportunities for their organization. Public visitors can browse without accounts.

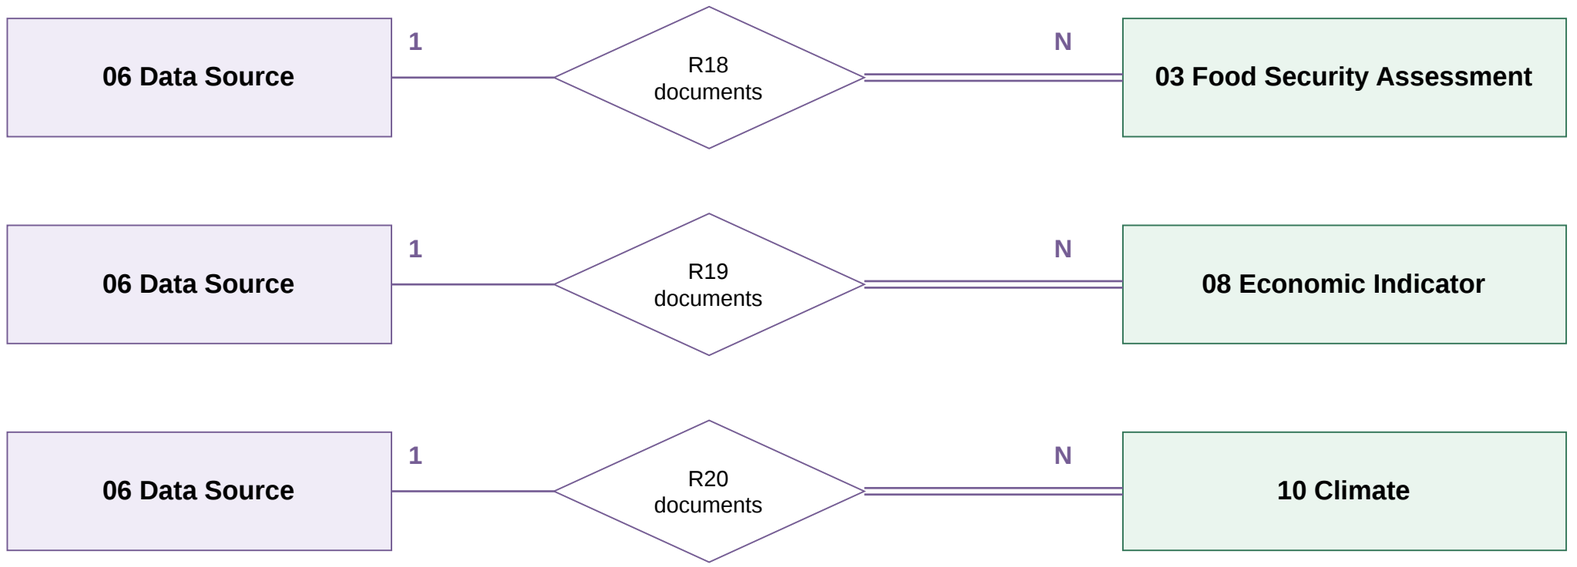

Ownership rule: the publishing User and the opportunity's Program must belong to the same Organization. R11 is repeated from page 5 for context.

Data sources & traceability

Every monitoring record cites one primary source release.

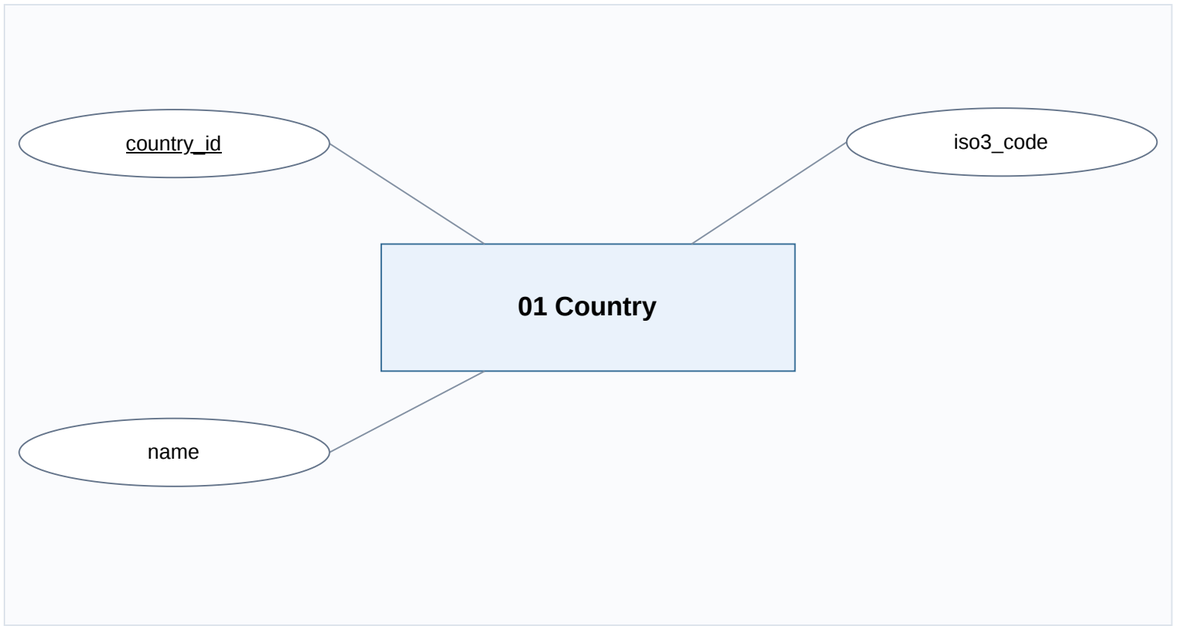

Data source entities are repeated references, not additional entities. Their six links are separated here to keep the pages clean.

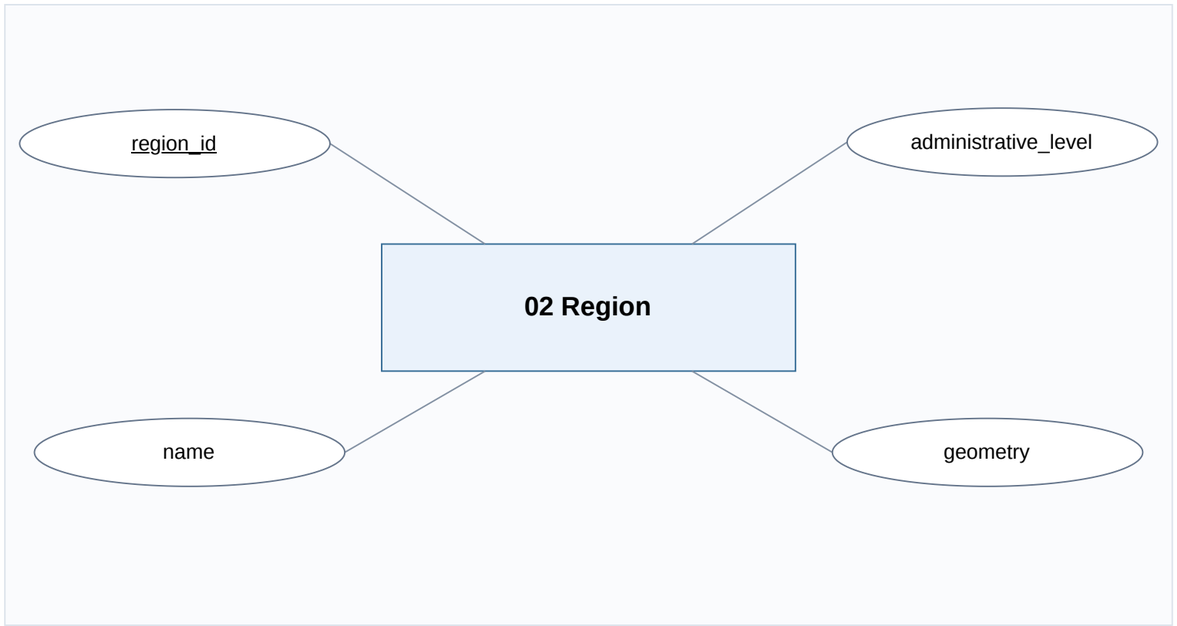

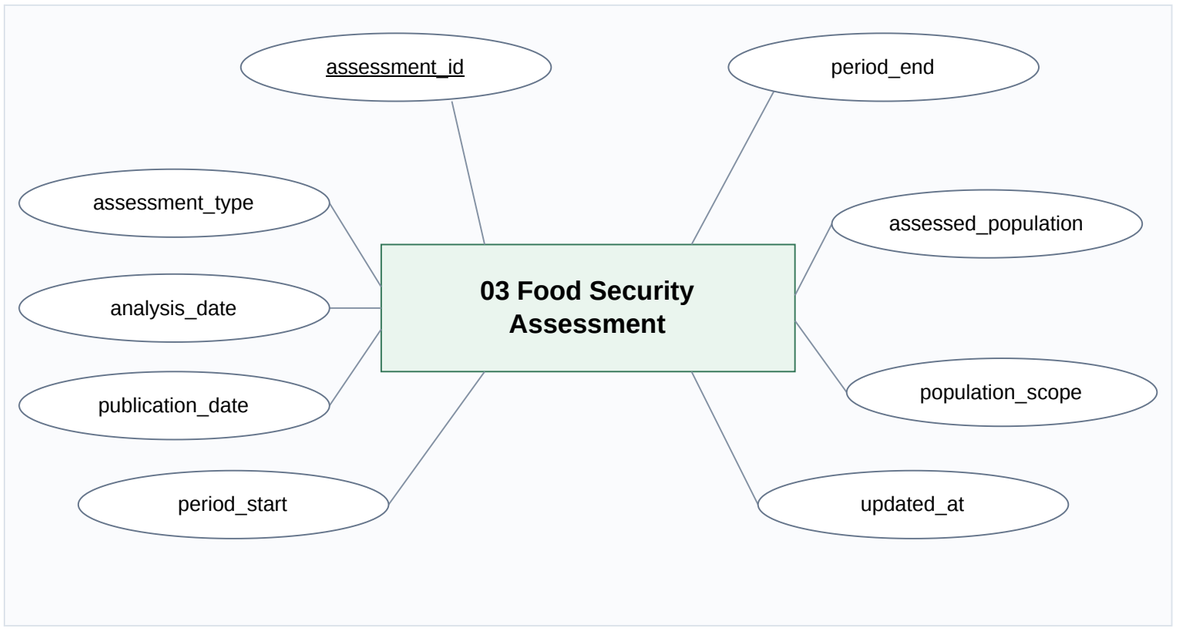

Source relationships are ordinary one-to-many relationships. Phase results inherit provenance through their parent assessment; they do not need a separate source link.

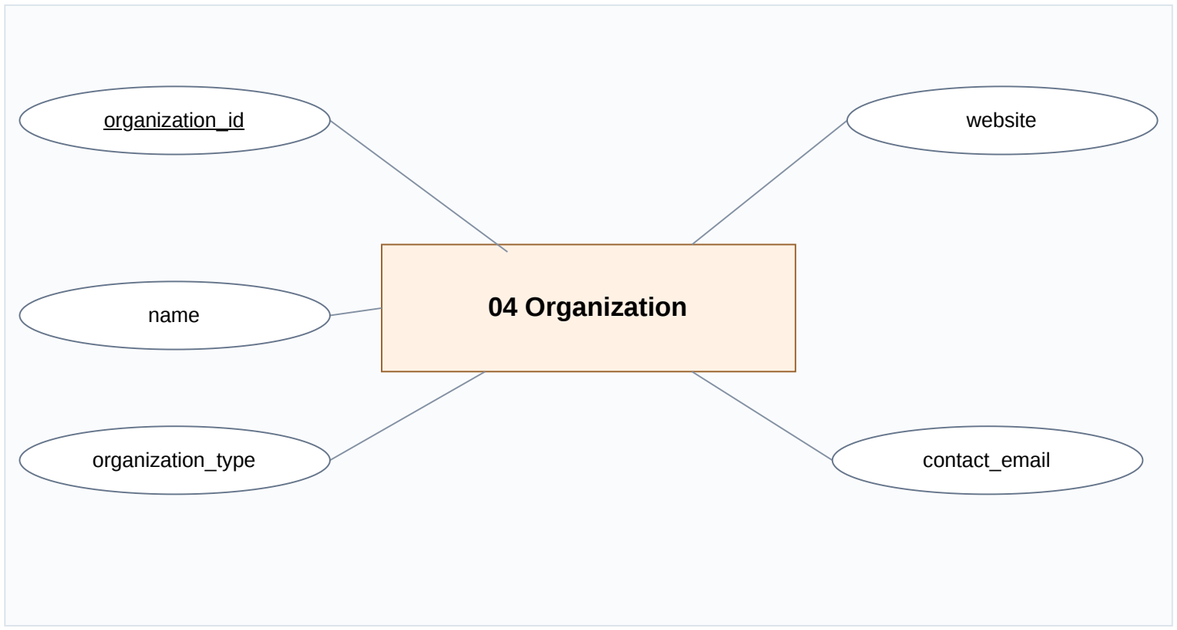

Entity attributes: 1 of 5

Each panel shows one entity with its complete attributes. Identifiers are underlined; derived attributes use dashed ovals.
